Review of PDFAssist's Requirement Document:

I think table of content would be nice to include in the beginning of the document.

Introduction: The word "system requirement" in introduction is confusing.

Scope of the Product: Author mentioned that this product will be used to rename large number of pdf files. Will it not be used for small number of pdf files? Names of new files is confusing. Is the program creating new file or just renaming existing file?

Business case of the Product: I believe that the business value we did not discussed in the class and I think it should not be the part of the requirement document.

User Requirement:
I think the author should have defined what title, is for this domain.

I believe we have discussed in the class that name of the publication (Journal or Conference name) should also be extracted but the authors did not mention this in requirement document.

What will the program do in case of throwing a error? Will the program continue to rename other files or the program will halt?

Interface Requirement: Here I think the user interface should have the option to take directory as input rather than a single pdf file.

The program also creates a window after extracting the information from input pdf file which is rather problematic. What if the user gives 100 files to rename? Will it create 100 new window? That would not be the user expectation.
